before the therapeutic potential of cell replacement therapy or the development of therapeutic drugs for stimulating the body's own regenerative ability to repair cells damaged by disease and injury can be fully realized control of stem cell fate immuno rejection and limited cell sources must be overcome in cellular programming and reprogramming methods and protocols expert researchers cover the most recent technologies and their related mechanisms involved in the programming and reprogramming of cell fate written in the highly successful methods in molecular biologytm series format chapters include introductions to their respective topics lists of the necessary materials and reagents step by step laboratory protocols and notes to highlight tips on troubleshooting and avoiding known pitfalls essential and cutting edge cellular programming and reprogramming methods and protocols promises to aid scientists attempting to advance stem cell biology in order to better treat devastating human diseases including cardiovascular disease neurodegenerative disease musculoskeletal disease diabetes and cancer

every cell in the human body contains the same genetic information with few exceptions yet each cell type enacts a distinct gene expression program to allow for highly specialized functions these tightly controlled programs are the results of transcriptional regulation by transcription factors and chromatin regulators as well as post transcriptional regulation mediated in part by micrornas mirnas additionally cells must respond to external cues and signal transduction pathways converge on gene regulatory machinery to shape cellular identity the work presented here focuses on the mechanisms by which transcription factors chromatin regulators mirnas and signal transduction pathways coordinately regulate two particular medically important gene expression programs 1 the program that controls pluripotency in embryonic stem es cells giving these cells the capacity to differentiate into every adult cell type and 2 the program that allows regulatory treg cells to prevent autoimmunity by suppressing the response of self reactive conventional t cells genomic investigations of the core regulatory circuitry of each of these cells types presented here provide new insight into the genetics of pluripotency and autoimmunity and suggest a strategy for reprogramming based on chemical manipulation of the cellular programs that
